

## ANZ Wholesale Engineering

### Technologies

- Java 15
- Spring Boot 2.4.3
- Maven
- JUnit 5

### Assumptions

- This project did not include any database. So, for testing purpose I have included some sample data in a java class called SampleData.java in utility package.
- I have included only few transaction enquiry sample data for an account number 123000345. So, code is not checking other accounts in account transaction entity because it has only one sample data. Because of that, account transaction enquiry will return same records for any account number.

### Running the code

Examples:

- View account list

<http://localhost:8080/viewAccountList>

- Account transaction enquiry

<http://localhost:8080/transactionEnquiry?accountNumber=123000345>
